EMPLOYEE WELLBEING · PRIVATE WORK SIGNALS

# PULSE

## Work better.
## Notice sooner.

A business overview of a privacy-first employee feedback and wellbeing product.

PRODUCT CONCEPT · EARLY STAGE

November 2026

PULSE / BUSINESS OVERVIEW

THE OPPORTUNITY

# Teams see activity. They often miss how work feels.

The product thesis: bring work-rhythm context and employee voice together—without expanding surveillance.

### Output without context

Activity totals can show that work happened, but not whether workload feels sustainable or a team needs support.

### Feedback without continuity

A periodic survey can capture sentiment, yet may not connect to week-by-week changes in work rhythm.

### Trust is the constraint

When people fear individual monitoring, honest participation is harder. Privacy has to be designed into the product.

**PULSE thesis** **A better signal is not more data about a person—it is safer context for a team conversation.**

THE PRODUCT

# One calm workspace. Three useful signals.

PULSE combines individual work awareness with anonymous team check-ins and aggregate reporting.

01

## Private time awareness

Session timing, active/idle separation, task labels and a configurable idle prompt.

02

## Anonymous weekly pulse

A short check-in on mood, stress and workload. Responses are not linked to an employee identity.

03

## Team-level action

Aggregate scorecards, trend signals, risk alerts and exportable reports for managers.

**Private for the individual → anonymous at the team layer → actionable in conversation**

EXPERIENCE

# From personal signal to supportive action.

The workflow is designed to make the individual’s experience useful before it becomes a manager’s insight.

01

## Track privately

Capture session timing; separate idle time; let the employee label work.

02

## Check in weekly

Invite voluntary ratings for mood, stress and workload.

03

## Discuss patterns

Show safe team aggregates and trends; support a human conversation.

**No individual pulse answers in manager views**

TRUST ARCHITECTURE

# Privacy is a product boundary—not a settings toggle.

Specific controls in the current design help make the promise explainable.

| | |
|---|---|
| ✓ **Not collected** | Keystrokes · screenshots · screen content · URLs · browsing history |
| ✓ **Not exposed** | Individual pulse responses · personal activity timelines in manager views |
| ✓ **Suppressed** | Team aggregates below the organization’s minimum response size (default 5) |
| ✓ **Separated** | User-linked weekly receipts enforce participation separately from answer records |

**Operational note: organizations still need appropriate consent, access controls, retention and privacy review before collecting employee data.**

DECISION SUPPORT

# Turn weekly ratings into a conversation prompt.

A transparent aggregate score surfaces patterns; it is not a diagnosis or an individual performance rating.

ILLUSTRATIVE THRESHOLDS

| | |
|---|---|
| < 40 | Low |
| 40–64 | Medium |
| 65+ | High |

Base score blends four aggregate signals; week-over-week movement contributes a capped 10% when an eligible prior week exists.

ALERTS ARE AGGREGATE-ONLY

WHO IT SERVES

# Start where work rhythms and team trust both matter.

Initial customer profiles are hypotheses to validate through discovery and design-partner pilots.

### People / HR leaders

Need an earlier, privacy-conscious view of team wellbeing patterns.

### Team managers

Need practical signals to guide retrospectives and workload conversations.

### Employees

Need personal awareness without screen monitoring or individual pulse exposure.

## Pilot discovery questions

- What makes a wellbeing signal trustworthy enough to act on?
- Who owns budget, rollout and employee communication?

BUSINESS MODEL

# A simple per-person subscription ladder.

Current product pricing page proposes monthly per-person prices and a 7-day trial; validate willingness to pay in pilots.

### Starter

**$8**

per person / month

**Personal habits**

Time tracking · Idle detection · Weekly pulse

### Team

**$16**

per person / month

**Team signals**

Starter features · Anonymous scorecards · Burnout alerts + reports

### Business

**$28**

per person / month

**Organization-wide**

Team features · Unlimited teams · Advanced trends + priority support

*Yearly billing is shown as 20% off on the product page. Prices are proposed, not validated revenue or contracted pricing.*

GO-TO-MARKET

# Earn trust in focused pilots before scaling.

Recommended first motion: recruit design partners, prove adoption and usefulness, then systematize acquisition.

**01 DISCOVER**

Interview HR, managers and employees; test privacy language and buying owner.

**Output: validated problem + pilot criteria**

**02 PILOT**

Run a time-boxed team trial; measure participation, repeat use and actionability.

**Output: evidence + product fixes**

**03 PACKAGE**

Turn proven use cases into onboarding, templates and a repeatable team rollout.

**Output: sales-ready offer**

## Pilot success metrics to define with partners

Activation · weekly response rate · repeat use · manager action taken · employee trust feedback

POSITIONING

# A human signal layer—not another surveillance dashboard.

PULSE aims to connect personal awareness and team-level context while keeping individual wellbeing responses private.

| ACTIVITY TOOLS | PULSE | PULSE SURVEYS |
| --- | --- | --- |
| Often emphasize time or output; may not include a voluntary wellbeing pulse. | Combines private activity timing, weekly pulse signals and suppressed team aggregates. | Capture feedback, but may not pair it with day-to-day work-rhythm context. |

## Differentiation to validate

- Useful without individual surveillance
- Privacy thresholds people can explain
- Signals designed to prompt conversation

EXECUTION

# Prove the foundations. Then scale the workflow.

Suggested roadmap; timing and scope should be set with design partners and engineering capacity.

NOW

## Harden

Complete deployment wiring; verify auth, data paths, security and billing configuration.

NEXT

## Validate

Run design-partner pilots; test response thresholds, onboarding and manager actionability.

LATER

## Scale

Improve integrations, team rollout tooling, analytics quality and operational readiness.

**North-star outcome** **Teams can notice strain earlier and act—without weakening employee trust.**

THE NEXT STEP

# Build trust.
# Prove value.
# Scale carefully.

We’re looking for design partners willing to test a privacy-first approach to employee feedback and work-rhythm awareness.

1. Share current wellbeing / workload listening challenges
2. Co-design a small, consent-led team pilot
3. Define what useful and trustworthy outcomes look like
